(54) Antibacterial antiplaque mouthwash composition.

(57) An oral composition mouthwash or liquid dentifrice containing an aqueous vehicle acceptable vehicle including an alcohol, a substantially water-insoluble noncationic antibacterial antiplaque agent, such as 2,4,4'-trichloro-2'-hydroxy-diphenyl ether (triclosan) wherein the antiplaque agent is entirely dissolved in the solvent and the weight ratio of water to alcohol is in excess of about 10:1.

EP 0 579 383 A1

Jouve, 18, rue Saint-Denis, 75001 PARIS

This invention relates to an antibacterial antiplaque mouthwash composition. More particularly, it relates to a mouthwash composition containing a substantially water-insoluble noncationic antibacterial agent effective to inhibit plaque.

Dental plaque is a soft deposit which forms on teeth as opposed to calculus which is a hard calcified deposit on teeth. Unlike calculus, plaque may form on any part of the tooth surface, particularly including at the gingival margin. Hence, besides being unsightly, it is implicated in the occurrence of gingivitis.

Accordingly, it is highly desirable to include antimicrobial agents which have been known to reduce plaque in oral compositions. Frequently, cationic antibacterial agents have been suggested.

It is an advantage of this invention that a mouthwash composition is obtained in which substantially water-insoluble noncationic antibacterial agent is solubilized without excessive presence of solvent to provide substantial antiplaque effectiveness.

It is an advantage of this invention that substantial antiplaque effectiveness is attained even when the said AEA is not present.

It is an advantage of the invention that by limiting the amount of solvent for the antibacterial agent while achieving its complete solubilization in the mouthrinse, possible side-effects of the solvent, such as a "burning" sensation provided by alcohol, are reduced.

It is an advantage of this invention that the antiplaque mouthwash is effective when used before or after toothbrushing.

Additional advantages of this invention will be apparent from consideration of the following specification.

In accordance with certain of its aspects, this invention relates to a mouthwash composition having a vehicle comprising water and an aqueous nontoxic alkyl mono- or di-hydric alcohol and dissolved therein an effective antiplaque amount up to about 0.09% of a substantially water insoluble noncationic antibacterial agent, said alcohol being a solvent for said antibacterial agent, wherein the weight ratio of water to alcohol is in excess of about 10:1 and the amount of solvent is sufficient to completely dissolve said antibacterial agent in said mouthwash composition.

Typical examples of water insoluble noncationic anti-bacterial agents which are particularly desirable for their antiplaque effectiveness, safety and ease of formulation are:

Halogenated Diphenyl Ethers

2',4,4'-trichloro-2'-hydroxy-diphenyl ether (Triclosan)
2,2'-dihydroxy-5,5'-dibromo-diphenyl ether

Halogenated Salicylanilides

4',5'-dibromosalicylanilide
3,4'5'-trichlorosalicylanilide
3,4,5-tribromosalicylanilide
2,3,3',5-tetrachlorosalicylanilide
3,3,3',5-tetrachlorosalicylanilide
3,5-dibromo-3'-trifluoromethyl salicylanilide
5-n-octanoyl-3'-trifluoromethyl salicylanilide
3,5-dibromo-4'-trifluoromethyl salicylanilide
3,5-dibromo-3'-trifluoromethyl salicylanilide (Fluorophene)

Benzoin Esters

Methyl - p-Hydroxybenzoic Ester
Ethyl - p-Hydroxybenzoic Ester
Propyl - p-Hydroxybenzoic Ester
Butyl - p-Hydroxybenzoic Ester

Sesquiterpene Alcohols

Farnesol
Nerolidol
Bisabolol, (2 S,4'S)6 methyl-2-(4'-methylcyclohex-3'-enyl-5-en-2-ol (all forms)
Santalol α and β forms

Halogenated Carbanilides

3,4,4'-trichlorocarbanilide
 3-trifluoromethyl-4,4'-dichlorocarbanilide
 5 3,3,4'-trichlorocarbanilide

Phenolic Compounds

(including phenol and its homologs, mono- and poly-alkyl and aromatic halo (e.g. Cl, Br, I)-phenols, resorcinol and catechol and their derivatives and bisphenolic compounds). Such compounds include inter alia:

Phenol and its Homologs

Phenol
 15 2-Methyl - Phenol
 3-Methyl - Phenol
 4-Methyl - Phenol
 4-Ethyl - Phenol
 2,4-Dimethyl - Phenol
 20 2,5-Dimethyl - Phenol
 3,4-Dimethyl - Phenol
 2,6-Dimethyl - Phenol
 4-n-Propyl - Phenol
 4-n-Butyl - Phenol
 25 4-n-Amyl - Phenol
 4-tert-Amyl - Phenol
 4-n-Hexyl - Phenol
 4-n-Heptyl - Phenol
 2-Methoxy- (2-Propenyl)-Phenol (Eugenol)
 30 2-Isopropyl-5-Methyl-Phenol (Thymol)

Mono- and Poly-Alkyl and Aromatic Halophenols

Methyl - p-Chlorophenol
 35 Ethyl - p-Chlorophenol
 n-Propyl - p-Chlorophenol
 n-Butyl - p-Chlorophenol
 n-Amyl - p-Chlorophenol
 n-Hexyl - p-Chlorophenol
 40 Cyclohexyl - p-Chlorophenol
 n-Heptyl - p-Chlorophenol
 n-Octyl - p-Chlorophenol
 O-Chlorophenol
 Methyl - o-Chlorophenol
 45 Ethyl - o-Chlorophenol
 n-Propyl - o-Chlorophenol
 n-Butyl - o-Chlorophenol
 n-Amyl - o-Chlorophenol
 Tert-Amyl - o-Chlorophenol
 50 n-Hexyl - o-Chlorophenol
 n-Heptyl - o-Chlorophenol
 p-Chlorophenol
 o-Benzyl - p-Chlorophenol
 o-Benzyl-m-methyl - p-Chlorophenol
 55 o-Benzyl-m-methyl - p-Chlorophenol
 o-Phenylethyl - p-Chlorophenol
 o-Phenylethyl-m-methyl - p-Chlorophenol
 3-Methyl - p-Chlorophenol

	3,5-Dimethyl	- p-Chlorophenol
	6-Ethyl-3-methyl	- p-Chlorophenol
	6-n-Propyl-3-methyl	- p-Chlorophenol
	6-iso-Propyl-3-methyl	- p-Chlorophenol
5	2-Ethyl-3,5-dimethyl	- p-Chlorophenol
	6-sec Butyl-3-methyl	- p-Chlorophenol
	2-iso-Propyl-3,5-methyl	- p-Chlorophenol
	6-Diethylmethyl-3-methyl	- p-Chlorophenol
	6-iso-Propyl-2-ethyl-3-methyl	- p-Chlorophenol
10	2-sec amyl-3,5-dimethyl	- p-Chlorophenol
	2-Diethylmethyl-3,5-dimethyl	- p-Chlorophenol
	6-sec Octyl-3-methyl	- p-Chlorophenol
	p-Bromophenol	
	Methyl	- p-Bromophenol
15	Ethyl	- p-Bromophenol
	n-Propyl	- p-Bromophenol
	n-Butyl	- p-Bromophenol
	n-Amyl	- p-Bromophenol
	sec-Amyl	- p-Bromophenol
20	n-Hexyl	- p-Bromophenol
	Cyclohexyl	- p-Bromophenol
	o-Bromophenol	
	Tert Amyl	- o-Bromophenol
	n-Hexyl	- o-Bromophenol
25	n-Propyl-m,m-Dimethyl	- o-Bromophenol

Resorcinol and Its Derivatives

	Resorcinol	
	Methyl	- Resorcinol
40	Ethyl	- Resorcinol
	n-Propyl	- Resorcinol
	n-Butyl	- Resorcinol
	n-Amyl	- Resorcinol
	n-Hexyl	- Resorcinol
45	n-Heptyl	- Resorcinol
	n-Octyl	- Resorcinol
	n-Nonyl	- Resorcinol
	Phenyl	- Resorcinol
	Benzyl	- Resorcinol
50	Phenylethyl	- Resorcinol
	Phenylpropyl	- Resorcinol
	p-Chlorobenzyl	- Resorcinol
	5-Chloro	-2,4-Dihydroxydiphenyl Methane
	4'-Chloro	-2,4-Dihydroxydiphenyl Methane
55	5-Bromo	-2,4-Dihydroxydiphenyl Methane
	4'-Bromo	-2,4-Dihydroxydiphenyl Methane

Bisphenolic Compounds

- 2,2'-methylene bis (4-chlorophenol)
 2,2'-methylene bis (3,4,6-trichlorophenol)
 5 2,2'-methylene bis (4-chloro-6-bromophenol)
 bis (2-hydroxy-3,5-dichlorophenyl) sulfide
 bis (2-hydroxy-5-chlorobenzyl) sulfide

10 The noncationic antibacterial agent is present in the mouthwash composition of the present invention in an effective antiplaque amount up to about 0.09%, typically about 0.01-0.09% by weight, preferably about 0.03-0.06%. The antibacterial agent is substantially water-insoluble, meaning that its solubility is less than about 1% by weight in water at 25°C and even may be substantially non-existent. Thus, water is not a solvent even when the antibacterial agent is present in an amount such as 0.01%.

15 The preferred halogenated diphenyl ether is triclosan. The preferred phenolic compounds are phenol, thymol, eugenol, and 2,2'methylene bis(4-chloro-6-bromophenol). The preferred sesquiterpene alcohols are nerolidol and bisabolol.

20 In the present invention, the oral composition is a mouthwash and is liquid in character. In such composition the vehicle comprises a water-alcohol mixture, with the weight ratio of water to alcohol being in excess of 10:1, generally up to about 20:1, preferably about 10.5:1 to about 18:1 and more preferably about 12:1 to about 16:1. The total amount of water-alcohol mixture in this type of preparation is typically in the range of from about 70 to about 99.9% by weight. The alcohol is a non-toxic alkyl mono-or di-hydric alcohol such as ethanol, n-propanol, isopropanol or propylene glycol. Humectant such as glycerine, sorbitol or xylitol or mixtures thereof, may be present in amount or about 10-20% by weight. Reference herein to sorbitol refers to the material typically as available commercially in 70% aqueous solution. The humectants do not appear to be solvents for the antibacterial agent. In addition to the alcohol, solvents for the antibacterial agent which may be present particularly include surface active agent and flavor oil. Ethanol is the preferred non-toxic alcohol. The alcohol dissolves the water-insoluble non-cationic antibacterial agent, or if flavoring oil and/or surface-active agent is present, may assist in the solvent action.

25 In other words, as indicated, the noncationic antibacterial agent is substantially water-insoluble. However, in the mouthwash of the present invention, organic surface-active agent, flavoring oil and, particularly, non-toxic alcohol act as solvents which are believed to aid dissolving the antibacterial agent so that it can reach soft oral tissue at or near the gums as well as tooth surfaces. The noncationic antibacterial agent is entirely or substantially entirely dissolved in the mouthwash. Preferably the amount of alcohol does not exceed about 40% by weight over the amount required to completely dissolve the antibacterial agent and most preferably does not exceed about 20% by weight over the amount needed to completely dissolve the antibacterial agent in the mouthwash composition. Thus, in an aqueous mouthrinse containing 0.03% by weight of triclosan, minor amounts of organic surface - active agent and flavoring oil and ethanol, it would require about 5% by weight of ethanol to fully dissolve the triclosan, and most preferably, the amount of ethanol would be between 5% and about 7% by weight, with the weight ratio of water to ethanol being in excess of about 10:1. In this manner, it is possible to achieve optimum antiplaque effectiveness even if an antibacterial enhancing agent (AEA) is not present to assist delivery of the antibacterial agent and its retention at gum and tooth surfaces.

30 Organic surface-active agents are also desirably used in the compositions of the present invention to achieve increased prophylactic action, assist in achieving thorough and complete solvent dispersion of the antiplaque antibacterial agent throughout the oral cavity, and render the instant compositions more cosmetically acceptable. The organic surface-active material is preferably anionic, nonionic or amphotolytic in nature, and it is preferred to employ as the surface-active agent a detergents material which imparts to the composition detergents and foaming properties. Suitable examples of anionic surfactants are water-soluble salts of higher fatty acid monoglyceride monosulfates, such as the sodium salt of the monosulfated monoglyceride of hydrogenated coconut oil fatty acids, higher alkyl sulfates such as sodium lauryl sulfate, alkyl aryl sulfonates such as sodium dodecyl benzene sulfonate, higher alkyl sulfoacetates, higher fatty acid esters of 1,2-dihydroxy propane sulfonate, higher fatty acid esters of taurine and the substantially saturated higher aliphatic acyl amides or lower aliphatic amino carboxylic acid compounds, such as those having 12 to 16 carbons in the fatty acid, alkyl or acyl radicals, and the like. Examples of the last mentioned taurine and amides are N-methyl cocoyl taurinate, N-methyl-N-oleoyl taurinate, N-methyl-N-palmitoyl-taurinate, N-methyl-N-oleyl taurinate, N-sodium, potassium, and ethanolamine salts of N-Lauryl, N-myristoyl, or N-palmitoyl sarcosine which should be substantially free from soap or similar higher fatty acid material. The taurine compounds particularly assist solution. The use of the sarcosinate compounds in the oral compositions of the present invention is particularly advantageous since these materials exhibit a prolonged and marked effect in the inhibition of acid formation in the oral cavity due to carbohydrate breakdown in addition to exerting some reduction in the solubility of tooth enamel in acid.

solutions. Examples of water-soluble nonionic surfactants are condensation products of ethylene oxide with various reactive hydrogen-containing compounds reactive therewith having long hydrophobic chains (e.g. aliphatic chains of about 12 to 2 carbon atoms), which condensation products ("ethoxamers") contain hydrophilic polyoxyethylene moieties, such as condensation products of poly(ethylene oxide) with fatty acids, fatty alcohols, fatty amides, polyhydric alcohols (e.g. sorbitan monostearate) and polypropyleneoxide (e.g. Pluronic materials).

Surface active agent, including mixtures thereof, is typically present in amount of about 0.4-5% by weight, preferably about 0.4-0.6% for anionic agents and about 1-2.50% for non-ionic agents.

Although ethylene glycol can be a solvent, it is preferred that it not be the solvent alcohol. Significant amounts of polyethyl glycol particularly of molecular weight of 600 or more should be avoided since polyethylene glycol effectively inhibits the antibacterial activity of the noncationic antibacterial agent. For instance, polyethylene glycol (PEG) 600 when present with triclosan in a weight ratio of 25 triclosan:1 PEG 600 reduces the antibacterial activity of triclosan by a factor of about 16 from that prevailing in the absence of the polyethylene glycol.

Any suitable flavoring oil and/or sweetening material may also be employed. As indicated above, the flavoring oil is believed to assist as a solvent for the antibacterial agent. Examples of suitable flavoring oils are e.g. oil of spearmint, peppermint, wintergreen, sassafras, clove, sage, eucalyptus, marjoram, cinnamon, lemon, and orange. Suitable sweetening agents include sucrose, lactose, maltose, xylitol, sodium cyclamate, perillartine, AMF (aspartyl phenyl alanine, methyl ester), sodium saccharine and the like. Suitably, flavoring oil may comprise from about 0.04% to 5% typically about 0.08-2.5%, preferably about 0.08-0.15% by weight. Sweetener may comprise about 0.005-2.5%, preferably about 0.005-0.01% for sodium saccharine and about 1-2.5% for sodium cyclamate.

Patent disclosures referred to above describe antibacterial-enhancing agent (AEA) to enhance delivery of antibacterial agent to and retention on oral surfaces. A particular improvement of the present invention is that AEA is optionally employed in amounts of up to about 4% or more, such as about 0.05% to about 4%, preferably about 0.1% to about 3%, more preferably about 0.5% to about 2.5% by weight.

This AEA may be a simple compound, preferably a polymerisable monomer, more preferably a polymer, which latter term is entirely generic, including for example oligomers, homopolymers, copolymers of two or more monomers, ionomers, block copolymers, graft copolymers, cross-linked polymers and copolymers, and the like. The AEA may be natural or synthetic, and water insoluble or preferably water (saliva) soluble or swellable (hydratable, hydrogel forming). It may have an average molecular weight of about 100 to about 1,000,000, preferably about 1,000 to about 1,000,000, more preferably about 2,000 or 2,500 to about 250,000 or 500,000.

The AEA ordinarily contains at least one delivery-enhancing group, which is preferably acidic such as sulfonic, phosphinic, or more preferably phosphonic or carboxylic, or a salt thereof, e.g. alkali metal or ammonium, and at least one organic retention-enhancing group, preferably a plurality of both the delivery-enhancing and retention-enhancing groups, which latter groups preferably have the formula -(X)n-R wherein X is O, N, S, SO, SO₂, P, PO or Si or the like, R is hydrophobic alkyl, alkenyl, acyl, aryl, alkaryl, aralkyl, heterocyclic or their inert-substituted derivatives, and n is zero or 1 or more. The aforesaid "inert-substituted derivatives", are intended to include substituents of R which are generally non-hydrophilic and do not significantly interfere with the desired functions of the AEA as enhancing the delivery of the antibacterial agent to, and retention thereof on, oral surfaces such as halo, e.g. Cl, Br and I, and the like. The polycarboxylate methyl vinyl ether/maleic anhydride copolymer, for instance, available as Gantrez is preferred.

The AEA can provide a thickening quality to increase the viscosity of the mouthwash. Such increase in viscosity may also be achieved by employing a minor amount, such as about 0.01-0.1% by weight, preferably about 0.02-0.06% of a thickener, such as xanthan.

The mouthwash desirably may also contain sodium benzoate which has been described as an antiplaque agent in U.S. Patent 4,657,758 of Goldenberg et al and is also known as a preservative. It is typically present in amount of about 0.05-1% by weight, preferably about 0.1-0.8%.

Sodium bicarbonate which is disclosed in U.S. Patent 4,132,770 of Barth as an additive to mouthwash to stimulate and refresh taste also may be desirably included in mouthwash of the present invention in amount of about 0.05-10% by weight, preferably about 0.1-1%.

Allantoin, aluminum dihydroxy allantoinate and aluminum chlorohydroxy-allantoinate are disclosed in U.S. Patent 3,928,555 of Gault as agents to promote healing of sensitive oral tissue. Such agent may also be desirably employed in mouthwash of the present invention. A desirable range is about 0.1-1% by weight, preferably about 0.1-0.5%.

When sodium benzoate, sodium bicarbonate and allantoin are present the mouthwash is most preferably introduced into the oral cavity before toothbrushing.

The oral mouthwash composition may also contain an anticaries amount of fluoride ion source sufficient to supply about 25 ppm. to 5,000 ppm. of fluoride ions. The sources of fluoride ions, or fluorine-providing com-

ponent are well-known in the art as anti-caries agents. These compounds may be slightly soluble in water or more preferably fully water-soluble. They are characterized by ability to release fluoride ions in water and by substantial freedom from undesired reaction with other compounds of the oral preparation. Among these materials are inorganic fluoride salts, such as soluble alkali metal fluorides, for example, sodium fluoride, potassium fluoride and ammonium fluoride, as well as a copper fluoride such as cuprous fluoride, zinc fluoride, barium fluoride, sodium fluorosilicate, ammonium fluorosilicate, sodium fluorozirconate, ammonium fluorozirconate, sodium monofluorophosphate, aluminum mono-and di-fluorophosphate, and fluorinated sodium calcium pyrophosphate. Alkali metal and tin fluorides, such as sodium and stannous fluorides, sodium monofluorophosphate (MFP) and mixtures thereof, are preferred.

The amount of fluorine-providing compound is dependent to some extent upon the type of compound, its solubility, and the type of oral preparation, but it must be a non-toxic amount, generally about 0.0005% to about 3.0% in the preparation. In a mouthwash preparation, an amount of such compound which releases up to about 5,000 ppm of F ion by weight of the preparation is considered satisfactory. Any suitable effective anticaries minimum amount of such compound may be used, but it is preferable to employ sufficient compound to release about 100 to 2,000 ppm., more preferably about 100 or 300 to about 1,500 ppm of fluoride ion.

Typically, in the cases of alkali metal fluorides, this component is present in an amount up to about 2% by weight, based on the weight of the preparation, and preferably in the range of about 0.02% to 1%. In the case of sodium monofluorophosphate, the compound is preferably present in an amount of about 0.075-3%.

Various other materials may be incorporated in the oral preparations of this invention such as azacycloalkane diphosphonates (e.g. azacycloheptane diphosphonate compound), sodium salicylate, whitening agents, preservatives, silicones, chlorophyll compounds and/or ammoniated material such as urea, diammonium phosphate, and mixtures thereof. These adjuvants, where present, are incorporated in the preparations in amounts which do not substantially adversely affect the properties and characteristics desired. Significant amounts of zinc, magnesium and other metal salts and materials, generally soluble, which could complex with AEA with active components of the instant invention are to be avoided, particularly if AEA is present.

It will be understood that, as is conventional, the oral preparations are to be sold or otherwise distributed in suitable labelled packages. This a jar of mouthrinse will be a label describing it, in substance, as a mouthrinse or mouthwash and having directions for its use.

In the preferred practice of this invention an oral composition according to this invention such as a mouthwash containing a composition of the present invention is preferably applied regularly to dental enamel and oral tissue such as every day or every second or third day or preferably from 1 to 3 times daily, at a pH of about 4 to 8, generally about 6 to 8, for at least 2 weeks up to 8 weeks or more up to lifetime. The mouthwash is desirably used after toothbrushing or before toothbrushing.

The following examples are further illustrative of the nature of the present invention, but it is understood that the invention is not limited thereto, all amounts and proportions referred to herein and in the appended claims are by weight, unless otherwise indicated.

EXAMPLE 1

Differences in Triclosan delivery from mouthrinse vehicles which differ in solubilization capacity is illustrated by the following experiments:

The Saliva Coated Hydroxyapatite Uptake Test (SCHAP test) is an in vitro test model which mimics delivery of nonionic antimicrobials to oral surfaces. In this test, saliva coated Hydroxyapatite (HAP) disks are a model for pellicle coated teeth. They are incubated with mouthrinses for a set period of time (0.5 hour), rinsed and then the Triclosan adsorbed onto the disks is extracted and analyzed by high pressure liquid chromatography (HPLC).

This test was used to compare prototype Triclosan rinse formulation with the following variables:

(1) Humectants:

- A. 5% glycerine/3.5% sorbitol
- B. 10% glycerine/7% sorbitol
- C. 5% glycerine/14% sorbitol
- D. 20% glycerine/3.5% sorbitol
- E. 20% glycerine/14% sorbitol

(2) Solvents:

- F. 5% ethanol/0% propylene glycol
- G. 5% ethanol/7% propylene glycol
- H. 15% ethanol/0% propylene glycol
- I. 10% ethanol/7% propylene glycol

J. 15% ethanol/7% propylene glycol

The results of this and following SCHAP tests are analyzed by Taguchi Analysis (as described in Genichi Taguchi: Experimental Designs, 3rd Edition (Volumes 142), Maruzan 1976, Central Japan Quality Control Association, 1980) to determine individual component relationships to Triclosan uptake with the following results which demonstrate that lowering humectant and ethanol concentrations (and, therefore, increasing water concentration) increases uptake of antiplaque agent onto saliva coated HAP disks, thereby indicating increased retention of the antiplaque agent on oral tissues.

	<u>Component</u>	<u>Triclosan Uptake (ug/disk)</u>	<u>% Increase in Uptake</u>
10	15% Ethanol	17.82	----
15	5% Ethanol	22.67	27.2
20	7% Propylene glycol	17.64	----
25	0% Propylene glycol	22.86	29.6
30	10% Glycerine	16.60	----
35	5% Glycerine	23.90	44.0
40	14% Sorbitol	18.35	----
45	3.5% Sorbitol	22.15	20.7

In a second SCHAP test, two Triclosan rinse formulations differing in humectant, solvent and water concentration are compared:

(1) Rinse A (Low Water/High Solvent):

- o Humectants: 10% glycerine, 7% sorbitol
- o Solvents: 10% ethanol, 7% propylene glycol
- o Water: 65.05%
- o Polysorbate 20 0.1%
- o Triclosan: 0.03%

(2) Rinse B (High Water/Low Solvent Level Sufficient to dissolve all Triclosan):

- o Humectants : 15% glycerine
- o Solvents 6% ethanol
- o Water: 77.41%
- o Polysorbate 20 0.1%
- o Triclosan: 0.03%

The result of the SCHAP test are as follows:

	<u>Rinse</u>	<u>Triclosan Uptake (ug/disk)</u>	<u>% Increase in Uptake</u>
50	Rinse A	35.03 0.80	----
55	Rinse B	42.51 2.10*	21.4

*Statistically significant difference ($p=0.05$) vs Rinse A.

In a third SCHAP test, two similar Triclosan formulations but without polysorbate, are compared:

(1) Rinse A (Low Water/High Solvent)

- o Humectants: 10% glycerine, 7% sorbitol
- o Solvents: 10% ethanol, 7% propylene glycol
- o Water: 65.05%
- o Triclosan: 0.03%

(2) Rinse C (High Water/Low Solvent Sufficient to dissolve all Triclosan)

- o Humectants: 15% glycerine
- o Solvents: 6% ethanol
- o Water: 77.85%
- o Triclosan: 0.03%

The results of the SCHAP test are as follows:

<u>Rinse</u>	<u>Triclosan Uptake (ug/disk)</u>	<u>% Increase in Uptake</u>
Rinse A	28.56	2.20
Rinse C	47.53	2.50

*Statistically significant difference ($p=0.05$) vs Rinse A.

In a fourth SCHAP test, Triclosan formulations varying only in ethanol concentration are compared:

Rinse Ethanol Concentrations

- o 3% Ethanol
- o 6% Ethanol
- o 7.5% Ethanol
- o 12% Ethanol

The results of the SCHAP are as follows:

<u>Ethanol Concentration</u>	<u>Triclosan Uptake (ug/disk)</u>	<u>% Increase in Uptake</u>
12% Ethanol	37.93	1.58
7.5% Ethanol	41.76	3.38
6% Ethanol	45.94	1.11
3% Ethanol	46.09	2.79

*Statistically significant difference ($p=0.05$) vs 12% Ethanol.

It is noteworthy that increased uptake can also be obtained even with ethanol completely absent. However, the mouthrinse does not remain clear.

The above results indicate the following optimal ratios and deviations therefrom:

- o Triclosan/Humectants ratio of 0.03/15 or 1/500 or lower.
- o Triclosan/Solvent ratio of 0.03/6 or 1/200 or lower.
- o Triclosan/Water ratio of 0.03/78 or 1/2600 or higher.

When these parameters are observed the weight ratio of water to solvent exceeds about 10:1, triclosan is completely dissolved and the amount of ethanol is at least that required to completely dissolve Triclosan in the formula, without a very large excess.

Examples 1A and 1B

The formulations given above as Rinse B and Rinse C can be used as mouthwashes.

EXAMPLE 2

The following formula is an effective antiplaque mouthwash when applied to the oral cavity including teeth and gums after brushing:

5	INGREDIENTS	PARTS
10	Ethyl Alcohol	5.000
15	Flavor	0.500
20	Triclosan	0.030
25	Sodium Methyl Cocoyl Taurate (95%)	0.450
30	Sorbitol (70%)	20.000
35	Glycerine	5.000
40	Polyvinyl Methyl Ether/Maleic Anhydride Gantrez S-97	1.920
45	Sodium Hydroxide	0.120
50	Sodium Fluoride	0.025
55	Color (0.1% solution)	0.300
	Water	67.250

Any of phenol, thymol, eugenol and 2,2' methylene bis (4- chloro-6-bromophenol) can effectively replace triclosan and any of n-propanol, isopropanol and propylene glycol can effectively replace ethanol at the amount sufficient to completely dissolve the plaque inhibiting agent.

Example 3

The following formulas are effective mouthwashes when applied to the oral cavity including teeth and gums before or after brushing.

Ingredients	Parts	
	A	B
5 Deionized Water	77.952	77.732
Glycerine	15.000	15.000
Ethanol 95%	6.000	6.000
10 Sodium Methyl cocoyl Taurate	0.250	0.250
Sodium lauryl sulfate	0.200	0.200
Allantoin	0.200	0.200
15 Flavor	0.100	0.100
Sodium benzoate	0.100	0.100
Sodium salicylate	0.100	0.100
20 Triclosan	0.030	0.030
Xanthan gum	0.030	-
Sodium fluoride	0.025	0.025
25 FD&C Red #40 Color	0.008	0.008
Sodium saccharin	0.005	0.005
Methyl vinyl ether - Maleic Anhydride Copolymer - Gantrez S-97	-	0.250

30 Any of phenol, thymol, eugenol and 2,2'methylene bis (4- chloro-6-bromophenol) can be effectively substituted for triclosan.

Any of n-propanol, isopropanol and propylene glycol can be effectively substituted for ethanol

EXAMPLE 4

35 The following formulas are effective antiplaque mouthwashes when applied before or after toothbrushing:

40

45

50

55

	Ingredients	Parts		
		A	B	C
5	95% Ethyl Alcohol	6.000	6.000	6.000
	Flavor	0.157	0.080	0.157
	Triclosan	0.030	0.030	0.030
10	99% Glycerine	15.000	15.000	15.000
	Sodium methyl cocoyl Taurate (95%)	0.250	0.250	0.250
	Polyoxyethylene-Polyoxypropylene Block Copolymer Pluronic F-127	-	-	2.000
15	Sodium Lauryl Sulfate Powder	0.200	0.200	0.200
	Allantoin	0.200	0.200	0.200
	Sodium Benzoate	0.100	0.100	0.100
20	Sodium Bicarbonate (Extra fine)	0.100	0.100	0.100
	Sodium Salicylate	0.100	0.100	0.100
	Sodium Saccharin	0.010	0.010	0.010
25	Xanthan Gum	0.030	0.030	0.030
	Sodium Fluoride	-	-	0.025
	Color	0.007	0.007	0.007
30	Water	77.816	77.893	76.011

Any of phenol, thymol, eugenol and 2,2'-methyléne bis (4- chloro-6-bromophenol) as effectively replace triclosan and any of n-propanol, isopropanol and propylene glycol can effectively replace ethanol at the amount sufficient to completely dissolve the plaque inhibiting agent.

Example 5

The following pleasant tasting effective antiplaque mouthwash is prepared:

40

45

50

55

Ingredients	Parts
95% Ethyl Alcohol	6.000
5 Flavor	0.160
Nerolidol	0.040
Bisabolol	0.010
10 99% Glycerine	10.000
Sodium methyl cocoyl Taurate (95%)	0.250
Polyoxyethylene-Polyoxypropylene Block Copolymer Pluronic F-127	0.050
15 Sodium Lauryl Sulfate Powder	0.200
Sodium Saccharin	0.020
Xanthan Gum	0.030
20 Sodium Fluoride	0.025
Benzoic acid	0.015
Water	73.155

25 This invention has been described with respect to certain preferred embodiments and it will be understood that modifications and variations thereof obvious to those skilled in the art are to be included within the purview of this application and the scope of the appended claims.

30 **Claims**

1. A mouthwash composition having a vehicle comprising water and an aqueous nontoxic alkyl mono- or dihydric alcohol and dissolved therein an effective antiplaque amount up to about 0.09% of a substantially water insoluble noncationic antibacterial agent, the said alcohol being a solvent for the said antibacterial agent, wherein the weight amount ratio of water to alcohol is in excess of about 10:1 and the amount of solvent is sufficient to completely dissolve the said antibacterial agent in the said mouthwash composition.
2. A mouthwash as claimed in Claim 1 characterised in that the said antiplaque amount is about 0.01-0.09% by weight.
3. A mouthwash as claimed in Claim 2 characterised in that the said antiplaque amount is about 0.03-0.06% by weight.
4. A mouthwash claimed in any one of Claims 1 to 3 characterised in that the said weight ratio of water to alcohol is from about 10:1 to about 20:1.
5. A mouthwash as claimed in Claim 4 characterised in that the said weight ratio is from about 12:1 to about 16:1.
6. A mouthwash as claimed in any one of Claims 1 to 5 characterised in that the said alcohol is ethanol.
- 50 7. A mouthwash as claimed in any one of Claims 1 to 6 characterised in that the said antibacterial agent is triclosan.
8. A mouthwash as claimed in any one of Claims 1 to 6 characterised in that the said antibacterial agent is nerolidol.
- 55 9. A mouthwash as claimed in any one of Claims 1 to 8 characterised in that an antibacterial enhancing agent containing a delivery group and an organic retention enhancing group is present in an amount of about 0.05-7% by weight.

10. A mouthwash as claimed in Claim 9 characterised in that the said antibacterial enhancing group is a poly-carboxylate.
